

Respiratory Sensitization: Chemistry-based Identification

Dr Steve Enoch

s.j.enoch@ljmu.ac.uk

Reader in Computational Toxicology
School of Pharmacy and Biomolecular Sciences
Liverpool John Moores University

Respiratory Sensitization

- A range of LMW organic chemicals can cause respiratory sensitization e.g. isocyanates
- No suitable animal or *in-vitro* model – limited data
- Majority of reported respiratory sensitizers are from human case studies (occupational asthma)
- LLNA often used; however, not all skin sensitizers are also respiratory sensitizers

AOP: Respiratory Sensitization

Molecular Initiating Event / Key Event 1¹
KE1: covalent binding of low-molecular-weight chemicals to lung or skin proteins

¹Sullivan et al (2017) Applied In Vitro Toxicology 3, p213

Available Human Data

- 104 organic chemicals identified as being linked with occupational asthma²
- Chemicals identified from clinical reports
- Not all chemicals had confirmed bronchial challenge test data (considered the gold standard by physicians)
- Analysis of the dataset showed a number of clear irritants (e.g. acids)
- A set of 82 control chemicals were also identified

²Enoch et al (2012) Chemical Research in Toxicology 25, p2490

Structural Alerts: Respiratory Sensitization

- Clinical data have been used to develop structural alerts for respiratory sensitization
- It is based on the MIE being covalent protein binding (mainly to lysine)
- It can be used to identify chemicals likely to cause protein binding in the lung
- However, many of the alerts are developed from low numbers of chemicals
- The alerts are available in the OECD QSAR Toolbox

Structure-Activity Relationship

Low reactivity
No cross-linking

Low reactivity
Protein cross-linking

High reactivity
No cross-linking

Structural Alert Summary

Mechanistic domain	Number of alerts
Acylation	7
Michael addition	16
Schiff base formation	16
S _N 2	9
S _N Ar	4
Total	52

	Alert	No alert
Respiratory sensitizer (104)	95	9
Control (82)	7	75

Structural Alert Confidence

Ring opening acylation

Anhydrides

Cross-linking Schiff base

Di-aldehydes (Glyoxal, glutaraldehyde etc.)

Ethylenediamines

Ethanolamines

Piperazine

Extremely reactive $\text{S}_{\text{N}}\text{Ar}$

Cyanuric chloride

Formaldehyde releasers

Hydroxymethyl imidazolidine-2,4-diones

Methenamine

Extremely reactive Michael acceptors

Reactive dyes (quinones, quinone-imines etc.)

Cyano-acrylates

Azocarbonamide

Cross-linking acylation

Di-isocyanates

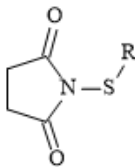

OECD QSAR Toolbox Meta Data

- All of the structural alerts are implemented in the Toolbox
- Importantly, the meta-data allows you to inspect the supporting evidence for an alert
- This is especially useful for alerts that have been developed from a single chemical
- As an example, consider two the S_N2 alerts:
N-alkylthiosuccinamides and chloro-nitrogens

Individual profile/alert/boundaries/other info applicable for defining categories within a profiler

Name	<u>N-Alkylthiosuccinamides</u>
Type of profile/alert	Structural alert

Description/ applicability domain	 <p>R = sp³ carbon</p> <p>Organic chemicals with a molecular weight less than 1000g/mol</p>
--	---

Mechanism	Chemicals containing a <u>N-alkylthiosuccinamides</u> moiety have been suggested to undergo an S _N 2 reaction with a di-sulphide linkage in proteins in the lung. It is important to note that in this reaction the exogenous chemical is acting as the nucleophile and the protein di-sulphide linkage as the electrophile [1].
------------------	---

Set of chemicals used for profile development (local training set)	The dataset from which the profiler was developed contained one chemical containing this alert, which has been reported as being a respiratory <u>sensitiser</u> in humans. [hyperlink to Excel file containing the data]
---	---

Data/Knowledge used for profile development	There has been a single peer-reviewed report of this alert causing respiratory sensitisation in humans in the work place [2].
--	---

Profile/alert analysis	Profile/alert	Number chemicals analysed (Total/ <u>Sensitisers</u>)
	<u>N-Alkylthiosuccinamides</u>	1/1

-------------------	--

Individual profile/alert/boundaries/other info applicable for defining categories within a profiler

Name	<u>Chloro nitrogen</u>
Type of profile/alert	Structural alert

Description/ applicability domain	R_2N-Cl R = any carbon, hydrogen Organic chemicals with a molecular weight less than 1000g/mol
--	--

Mechanism	Chemicals containing a <u>chloro nitrogen</u> moiety have been suggested to be oxidised to an epoxide which can then undergo a ring opening S _N 2 reaction [1].
------------------	--

Set of chemicals used for profile development (local training set)	The dataset from which the profiler was developed contained one chemical containing this alert, which has been reported as being a respiratory <u>sensitiser</u> in humans. [hyperlink to Excel file containing the data]
---	---

Data/Knowledge used for profile development	There have been several peer-reviewed reports of this alert causing respiratory sensitisation in humans in the work place [2-5].
--	--

Profile/alert analysis	Profile/alert	Number chemicals analysed (Total/ <u>Sensitisers</u>)
	<u>Chloro nitrogen</u>	1/1

-------------------	---

Structural Alerts: Biological Confidence

- The alerts were developed from clinical human data
- Work is on-going to develop biological support for the alert set – this is based on identifying AOP evidence
- It is envisaged that this will lead to a revised, more predictive, set of structural alerts

Episuite – Vapour Pressure

- We have previously rationalised the relatively low skin sensitization potency of acrylates in terms of their volatility³
- It might be assumed that chemicals need to be volatile to be respiratory sensitizers
- This turns out not to be the case

³Ebbrell et al (2017) Chemical Research in Toxicology 30, p604

Episuite – Vapour Pressure

0.24 mmHg (-1.63)

0.15 mmHg (-0.84)

0.00036 mmHg (-3.43)

5.23 mmHg (0.72)

7.41×10^{-19} mmHg (-18.13)

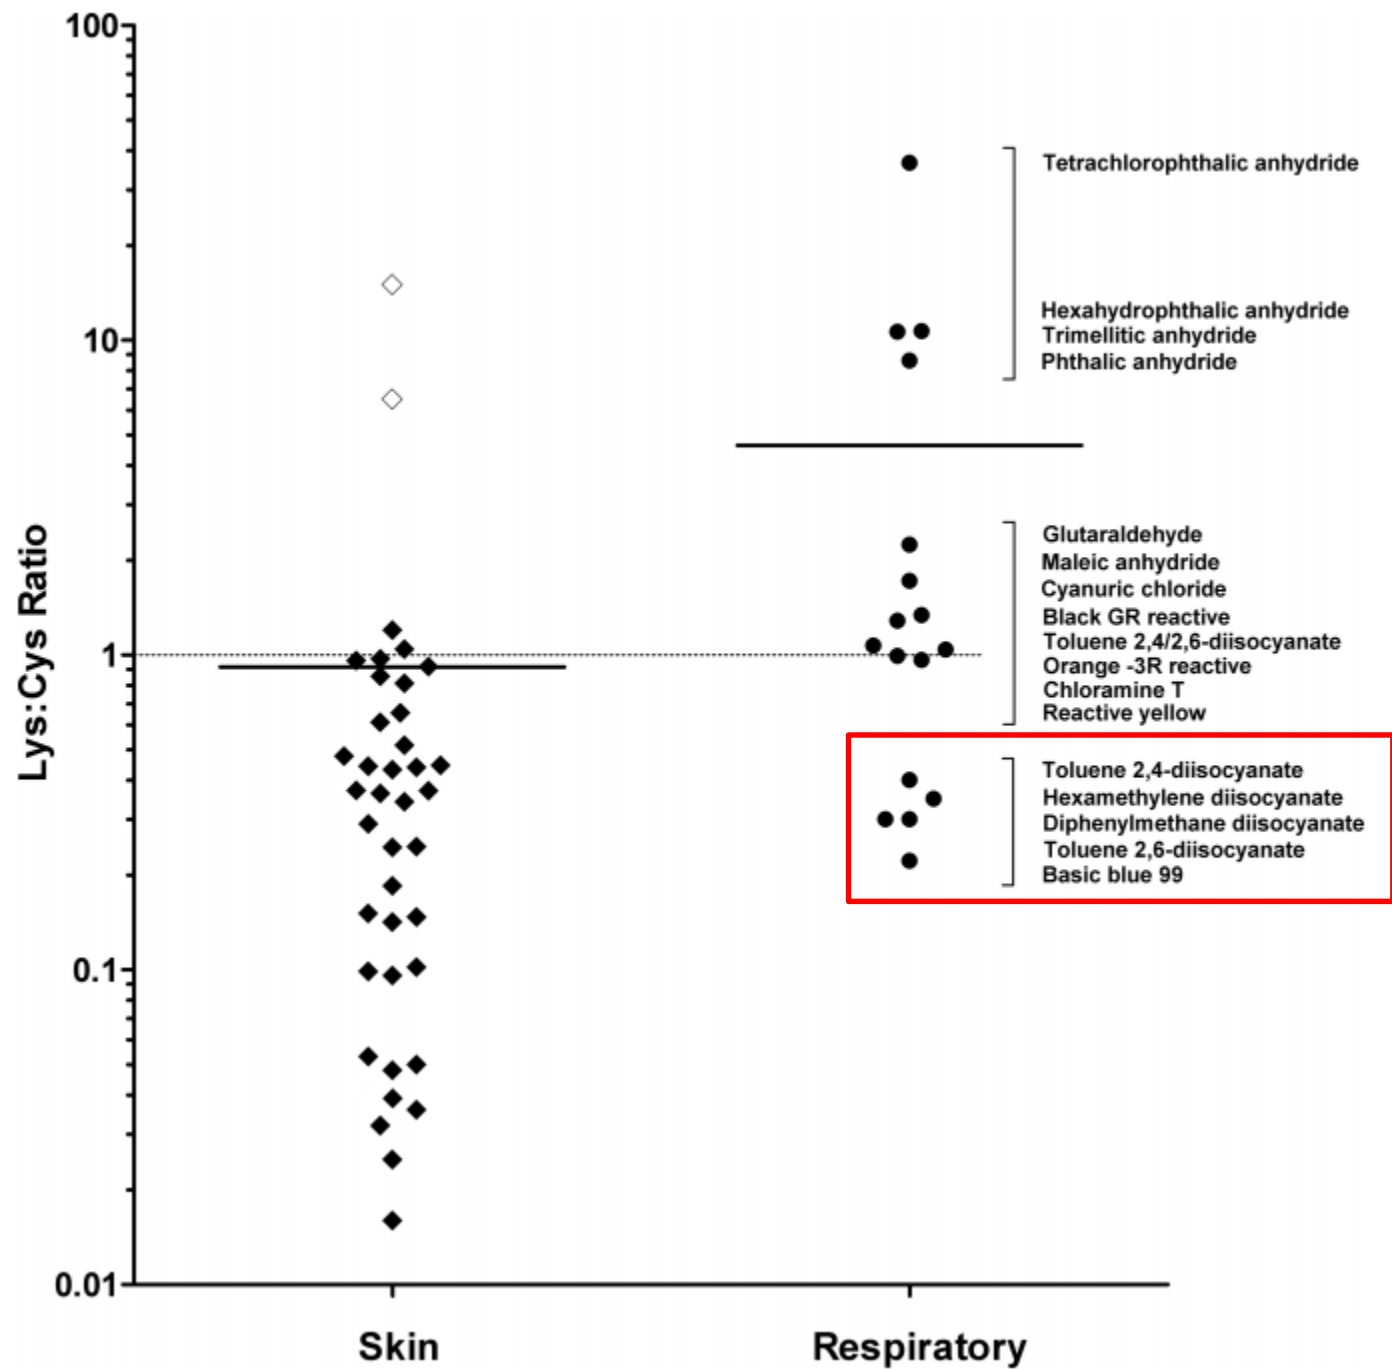

In Chemico: DPRA

- DPRA data can be used to identify direct acting respiratory sensitizers
- Lalko et al⁴ have shown the Lys/Cys ratio to be a useful discriminator
- Reaction conditions: 0.5 mM peptide to 5 mM (Cys, pH = 7.4) or 25 mM (Lys, pH = 10.2) of test material. Assay time = 24 hours

Structural Alerts and *In Chemico* Data

2,4-DNCB
Cys: 100%
Lys: 15%
Lys:Cys = 0.2
Alert: No

p-Benzoquinone
Cys: 99%
Lys: 91%
Lys:Cys = 0.9
Alert: Yes

Glyoxal
Cys: 57%
Lys: 68%
Lys:Cys = 1.2
Alert: Yes

Fluorescein isothiocyanate
Cys: 100%
Lys: 61%
Lys:Cys = 0.6
Alert: No

Conclusions

- A set of structural alerts exist for respiratory sensitization (encoded in the OECD QSAR TB)
- The alerts have varying levels of confidence (which can be assessed using the metadata)
- Respiratory sensitizers do not need to be highly volatile
- *In chemico* (DPRA) data can be used to identify potential respiratory sensitizers
- Combining the structural alerts (and SAR knowledge) with DPRA data enables respiratory sensitizers to be identified based on their MIE
